Assets

Here are various pictures and scripts that are used to parse the Json objects in the website. The pictures are used to serve as icons for the links that are clicked. The coffee scripts are condensed javascripts to display what items are needed to display on the page.

Index.coffee

This uses the Jquery api to call a http command go get all the json files in "/listings". It then pases them accordingly. But the for loop is used so only 3 of the posts are shown in the recent post list. It then appends the rest of the information in descending order.

Othersubjects.coffee

This uses the Jquery api to call a http command go get all the json files in "/listings". It then pases them accordingly. It then appends the rest of the information in descending order. Rather than putting 3 of the listings this one appends all of the listings for that relative subject.
