Configuration

These sets of files are used to set up the http routes, configure the database and get many libraries that are needed for the project. While the Application lass sets up the backbone of the infrastructure, the configuration files help build that backbone.

Routes.file

This holds the basic http GET and POST commands for the classes within the application to access. Along with these commands there as the URI links that the client would GET or POST to. After the GET and POST and the URI link there is a method that would point to the application class. Showing that calling a GET or POST method would also call for a method within the application class.

1.sql

This script configures the SQL database. It holds the query params and well as how much memory those params should hold. It uses Play's Framework to create a SQL table that can be used in other instances.

Application.comf

This creates the basic configuration for the controller class that would be extended by the application. This file defines which files need to be imported such as maeven for other web client sites.
